Summary of Water Quality Information

The City of Patterson drinking water system is owned by the City of Patterson and operated by Tindall Enterprises, Inc. The facility office is located at 3507 Williams Street in Patterson, Georgia. If there are ever any comments or inquiries to be made, please feel free to visit or call City Hall during regular working hours.

Included in this report is information about where your water comes from, what it contains, and how it compares to standards set by regulatory agencies. The **City of Patterson** is committed to providing your community with clean, safe, and reliable drinking water. For more information about your water or this report please call City Hall or Tindall Enterprises, Inc. at the 912-449-0999. **This report will not be mailed to individual consumers but is available at City Hall upon request**.

Your water comes from two (2) community *groundwater* wells, 101 and 102. Both wells are located on Highway 84 in Patterson, Georgia and derive water from the *Coastal Plain Aquifer* to provide ample volumes for your community. Treatment is performed at the wells to include removal of contaminants and addition of chlorine disinfection. These properties are protected from activities which could potentially cause contamination of the water source.

A Wellhead Protection Plan (WHPP) has been completed for the City of Patterson. This is a report in which the Georgia Department of Natural Resources Environmental Protection Division (GA DNR EPD) identifies any types of pollution to which the community water supply could be vulnerable and includes information regarding potential sources of contamination in the watershed. This system is considered to be in the higher susceptibility range for pollution, however, there are no potential pollution sources within the fifteen (15) foot radius control zone. Cited potential pollution sources within the management zone include electrical transformers, utility poles, sewer lines, access roads, secondary roads, and underground storage tanks of gas and/or diesel. A copy of this report is available upon request at City Hall.

The City of Patterson water system is tested for more than eighty (80) drinking water parameters on a periodic basis determined by the GA DNR EPD Drinking Water Program and/or the United States Environmental Protection Agency. Sampling/testing schedules are based on initial contaminant level assessments and may be changed if deemed necessary. Generally, the water system submits samples for the analyses of volatile organic compounds, inorganic compounds, lead, and copper at least once in a three (3) year cycle. Nitrate-nitrite, total trihalomethane, and haloacetic acid levels are tested annually, and bacteriological content is tested on a monthly basis. Water samples are also tested for radionuclides every six (6) years for well 102 and every nine (9) years for well 101. The City of Patterson has been issued a chemical monitoring waiver that exempts the water system from monitoring for synthetic organic compounds, asbestos, and cyanide effective through December 31, 2019.

During 2019, the City of Patterson water system submitted samples for the analyses of bacteriological content, nitratenitrites, volatile organic compounds, inorganic compounds, total trihalomethanes and haloacetic acids. We are pleased to inform you that the City of Patterson had no violations of drinking water standards during 2019. All detected contaminants are delineated in the accompanying chart. Any constituents not listed in the accompanying charts had results less than the detection limits and/or maximum contaminant levels.

Although the **City of Patterson** did not perform lead and copper analyses in 2019, it is important for you to know about the lead and copper levels in you water system. During the last monitoring event, ten (10) representative locations from throughout your community were sampled for the analyses of lead and copper. Detectable levels of lead and/or copper were found in one or more samples, indicating the presence of some service lines that contain these contaminants. **NO** site exceeded the action level limit for lead or copper. Lead and copper are metals naturally found throughout the environment in soil and water. These metals can also be found in lead, copper, or brass household plumbing pipes and fixtures. Even consumer products such as paints, pottery, and pewter can contain lead and/or copper. Corrosion or deterioration of lead or copper-based materials, as well as erosion of natural deposits can release these metals into the drinking water.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Patterson is responsible for providing high quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead.

Additionally, the following measures may also be taken to minimize exposure to lead and/or copper:

- Use cold water for drinking or cooking.
- Do not cook with or consume water from the hot water faucet.
- Do not use hot water for making baby formula.
- Use only "lead-free" solder, fluxes and materials in new household plumbing and repairs.

Some people may be more vulnerable to contaminants in drinking water than the general population. Contaminants may be found in drinking water that may cause taste, color, or odor problems. These types of problems are not necessarily a cause for health concerns. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. **EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 800-426-4791.**

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells and may reasonably be expected to contain at least small amounts of some contaminants. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. The presence of contaminants does not necessarily indicate that water poses a health risk. In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline.

Contaminants that <u>may</u> be present in source water include the following:

- *Microbial contaminants* such as viruses and bacteria which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- *Inorganic contaminants* such as salts and metals, which can be naturally occurring or result from urban storm runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- *Pesticides and herbicides* which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants including synthetic and volatile organic chemicals, which are by-products of
 industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff,
 agricultural application, and septic systems.
- Radioactive contaminants can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

The City of Patterson strives to maintain the highest standards of performance and quality possible. In order to maintain a safe and dependable water supply, improvements that benefit the community must be made. Please help keep these costs as low as possible by utilizing good water conservation practices.

DEFINITION OF TERMS AND ABBREVIATIONS USED IN THIS REPORT

<u>Maximum Contaminant Level (MCL):</u> "The highest level of a contaminant that is allowed in drinking water. MCL's are set as close to the MCLG as feasible using the best available treatment technology."

Maximum Contaminant Level Goal (MCLG): "The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLG's allow for a margin of safety."

Action Level (AL): "The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow."

Secondary Maximum Contaminant Level (SMCL): Reasonable goals for drinking water quality. Exceeding SMCL's may adversely affect odor or appearance, but there is no known risk to human health.

Treatment Technique (TT): "A required process intended to reduce the level of a contaminant in drinking water."

Maximum Residual Disinfectant Level (MRDL): "The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbiological contaminants."

Maximum Residual Disinfectant Level Goal (MRDLG): "The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Not Detected (ND): By regulation, this substance or group of substances was tested for in our finished tap water; however, none was detected at the testing limit.

TTHMs (Total Trihalomethanes): One or more of the organic compounds chloroform, bromodichloromethane, chlorodibromomethane, and/or bromoform.

HAA5s (Haloacetic Acids): One or more of the organic compounds monochloroacetic acid, dichloroacetic acid, trichloroacetic acid, monobromoacetic acid, and dibromoacetic acid.

NA: Not applicable to this contaminant

ppb or ug/l: parts per billion or micrograms per liter

ppm or mg/l: parts per million or milligrams per liter

pCi/l: picocuries per liter, a measurement of radiation

CITY OF PATTERSON WATER SYSTEM 2019 WATER QUALITY DATA WSID: GA2290001

The table below lists all the drinking water contaminants that have been detected in your drinking water. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. The data presented in this table is from testing done during the year noted. The Federal Environmental Protection Agency (EPA) and the Georgia Department of Natural Resources Environmental Protection Division (EPD) require monitoring for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year.

				DETECTED INORGAN	ECTED INORGANIC CONTAMINANTS TABLE	3 TABLE

2019 Water Quality Report Notice of Availability

Community Water System Name:	CITY OF PATTERSON
Georgia Water System ID #:	GA2290001

The Community Water System identified above does hereby confirm that a 2019 Water Quality Report has been published in the local legal organ and submitted to the Georgia Department of Natural Resources Environmental Protection Division. The City of Patterson did not have any violations of water quality parameters for the year 2019.

Copies of this report will not be sent to individual consumers. It is being published in the newspaper, and a copy is available to you at City Hall upon request in person, by phone, or by e-mail.

For a copy of this document or other inquiries please contact:

CITY OF PATTERSON
P.O. BOX 434
3507 Williams Street
PATTERSON, GEORGIA 31557
Phone: 912-647-5776
